## **Abstract**

The Albertine graben forms the northernmost part of the western arm of the great East African Rift System (EARS). It runs from Rwanda in the south to the Uganda/Sudan border in the North. Within this graben, the ages of the sediments especially in the subsurface, and their palaeoecological and palaeoclimatological implications have been unknown despite the extensive exploration for oil.

Biostratigraphic studies recently carried out on four wells from the Semliki and Kaiso-Tonya basins located within the graben resulted in recognition of over 80 types of palynomorphs with their respective frequency distributions. This in turn resulted in a palynostratigraphic zonation of the basins. Four distinctive zones ranging from Lower Miocene to Pleistocene were established in the Semliki Basin. Two of these zones are also evident in the Kaiso-Tonya Basin. Comparisons made with the stratigraphic occurrence of similar microfloras recorded by numerous authors within tropical areas permitted calibration of the palynozones. The formations in which they were identified have thus been dated.

The source of palynomorphs was probably in the hinterland and other adjacent low-lying land such as swamps, transported to the depositional site by streams as observed from the palynoflora spectrum. Sediment accumulation involved deposition in deep freshwater environment, followed by deposition in a shallow fresh-brackish water deltaic environment, and finally, by fluvial or fan delta deposition in lake margin facies. Burial of sediments was not deep enough for their organic contents to be rendered thermally mature. Variations in depositional conditions and source areas are in the character of the assemblages and in the density of palynomorph population, interpreted to be predominantly due to climatic fluctuations. The climate that prevailed was probably warm and humid.

# PRESENTATION OUTLINE

## 1. Introduction

- The Albertine Graben
- Tectonic setting and geologic history
- Study objectives

## 2. Materials & methods

- Sample processing
- Analysis and interpretation of data

## 3. Preliminary Results

- Biostratigraphy
- Correlation
- Paleoenvironments

## 4. Conclusion

# THE ALBERTINE GRABEN

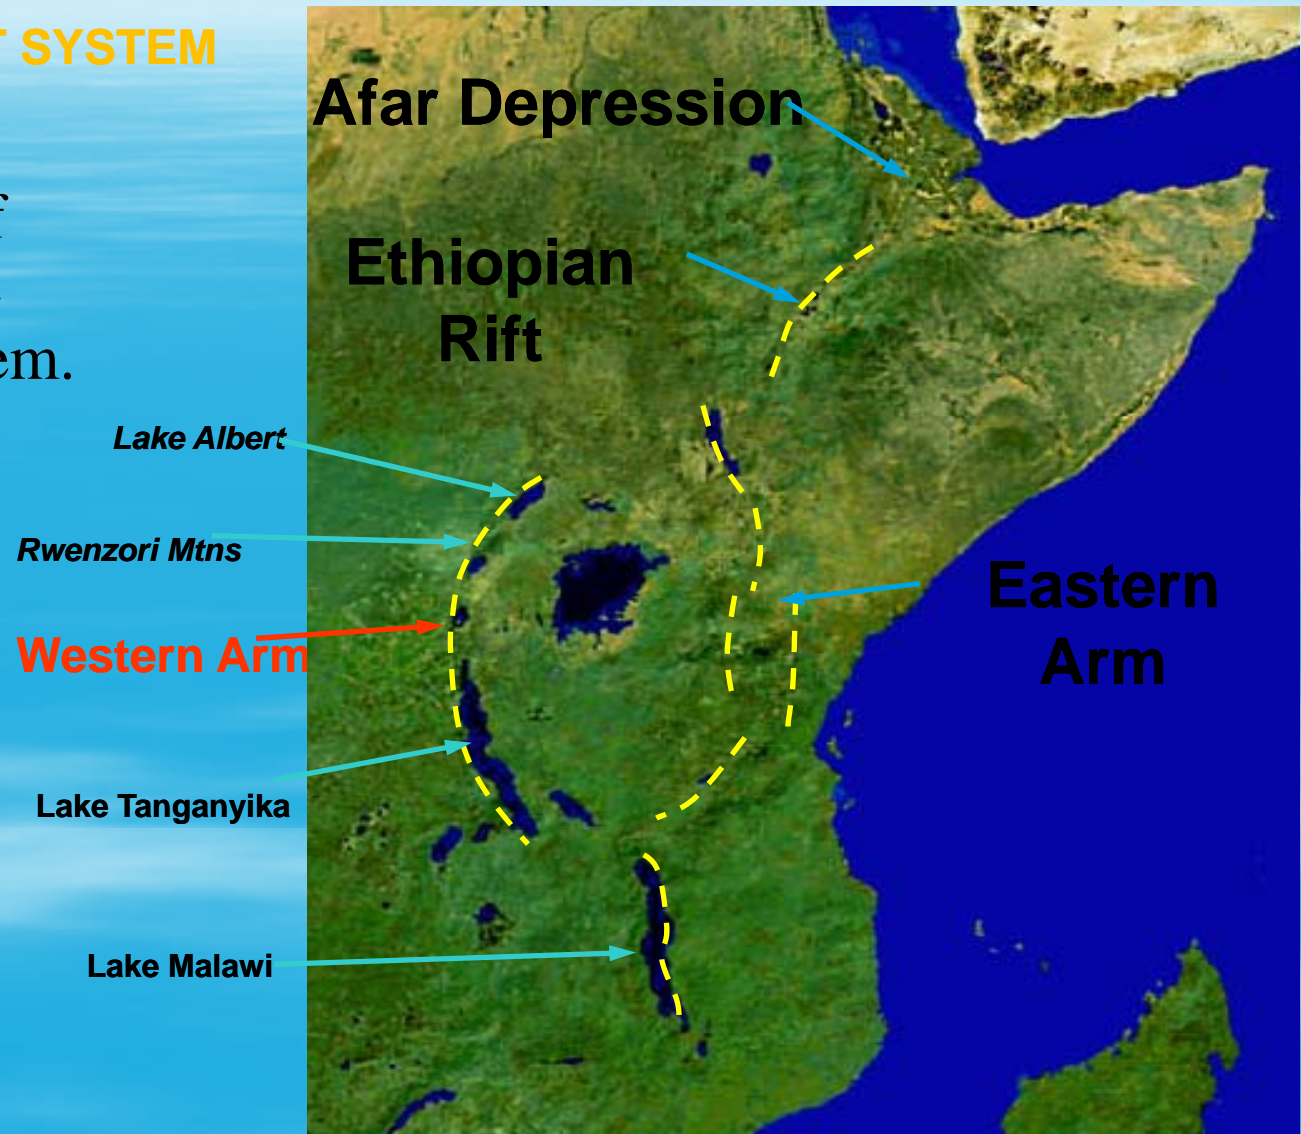

## THE EAST AFRICAN RIFT SYSTEM

- Northern most part of the Western arm of the East African Rift System.

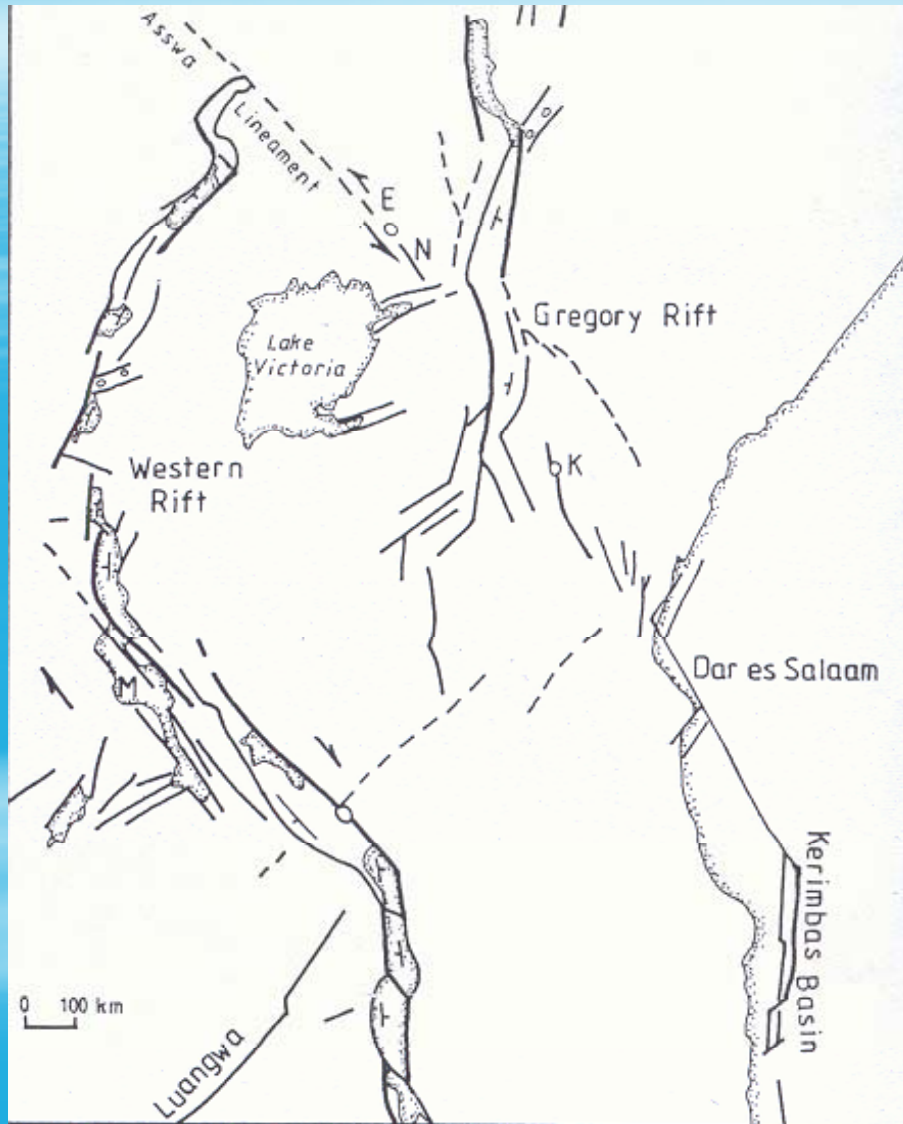

- Stretches from Rwanda in the south to Sudan/Uganda border in the north.

- Shared with the Democratic Republic of Congo

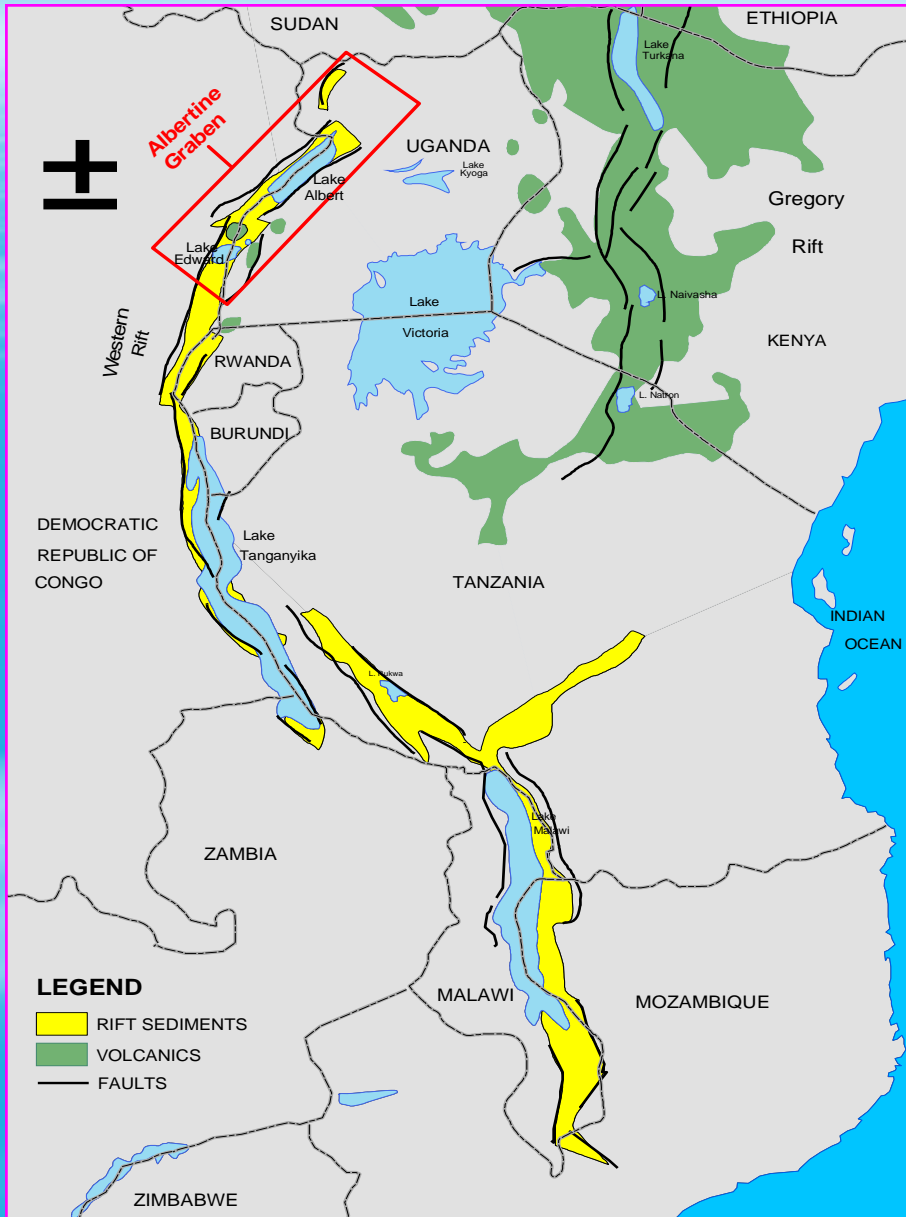

# THE ALBERTINE GRABEN; Tectonic Setting and Geologic History

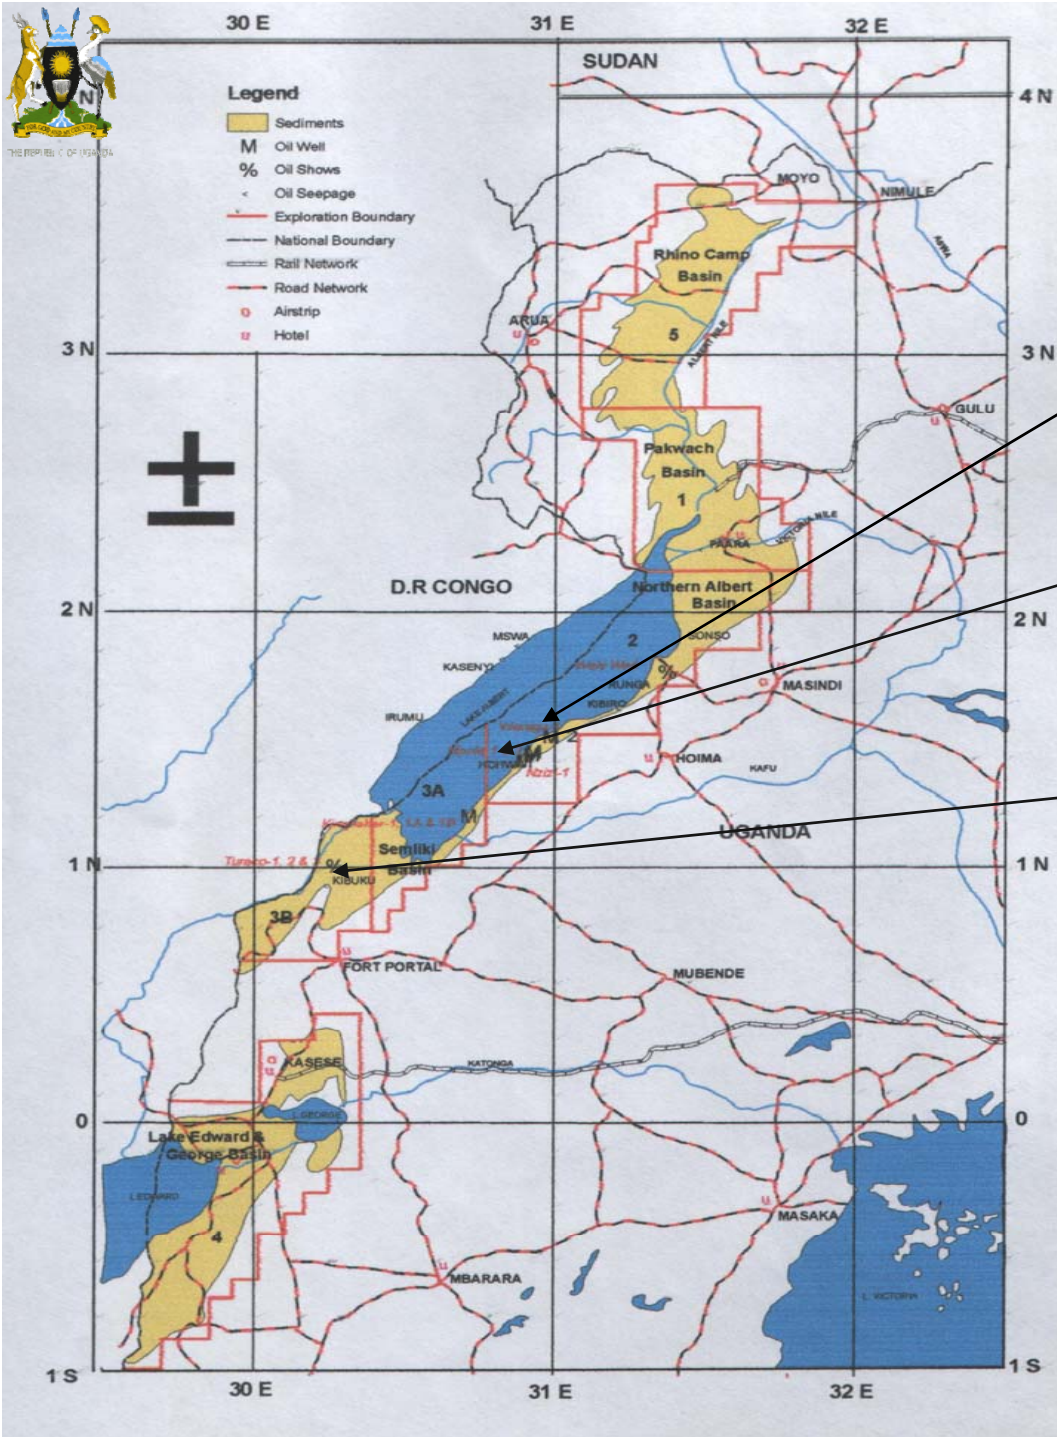

- Characterized by a big boundary faults on one side, sets of smaller step faults
- Major faults are normal, trending NE-SW.
- Trends N-S, north of L. Albert,
  - Along the Nile northwards until they are terminated by the NW-SE trending Aswa shear zone.

# THE ALBERTINE GRABEN; Tectonic Setting and Geologic History

- Less volcanism compared to eastern branch
- Altitude: 500m ASL prior to faulting.
  - Faulting later formed a shallow downwarp filled with fluvial sediments and evaporites.
- Both pre-rift & syn-rift sections exposed
  - The pre-rift: high-grade metamorphosed and igneous.
  - Syn rift section: clastic sediments in fluvio-deltaic & lacustrine environments

# SAMPLE LOCATIONS

Waraga- well (North Albert Basin)

Mputa-1 & Mputa-2 well:  
Approx 2 km apart  
(North Albert Basin)

Turaco well  
(Semliki Basin)

## STUDY OBJECTIVES

### **Previous biostratigraphy studies;**

- Based on macropalaeontology of surface samples
- Spore and pollen studies mainly in quaternary palynology.

•But the age and paleoenvironments of subsurface sediments remain unknown.

### **•This study therefore aims to:**

- Determine the possible age of the sediments in subsurface
- Construct a palynostratigraphic zonation and correlation
- Interpret sedimentary environments, composition of the vegetation and climate during the period of deposition.

# MATERIALS AND METHODS

- **Materials used:** Rock cuttings.
- **Methods:**
  - **Sample processing:**
    - Standard palynological techniques; spores, pollen, algal remains, and POM are the key extracts
  - **Slide examination:**
    - By Leica DM transmitted light microscope at x1000 under oil.
    - 200 specimens counted per slide
    - Turaco well- reference section for the area

# PRELIMINARY RESULTS

## Palynological zonation

• Four informal zones described;

### 1: *V.usmensis*-*E.estelae* zone

#### Characteristics:

-FDO of *V. usmensis*, *V. favus* and *E. estelae* (Top).

-influx of *Graminitides gracilis* influx (Base)

#### Occurrence:

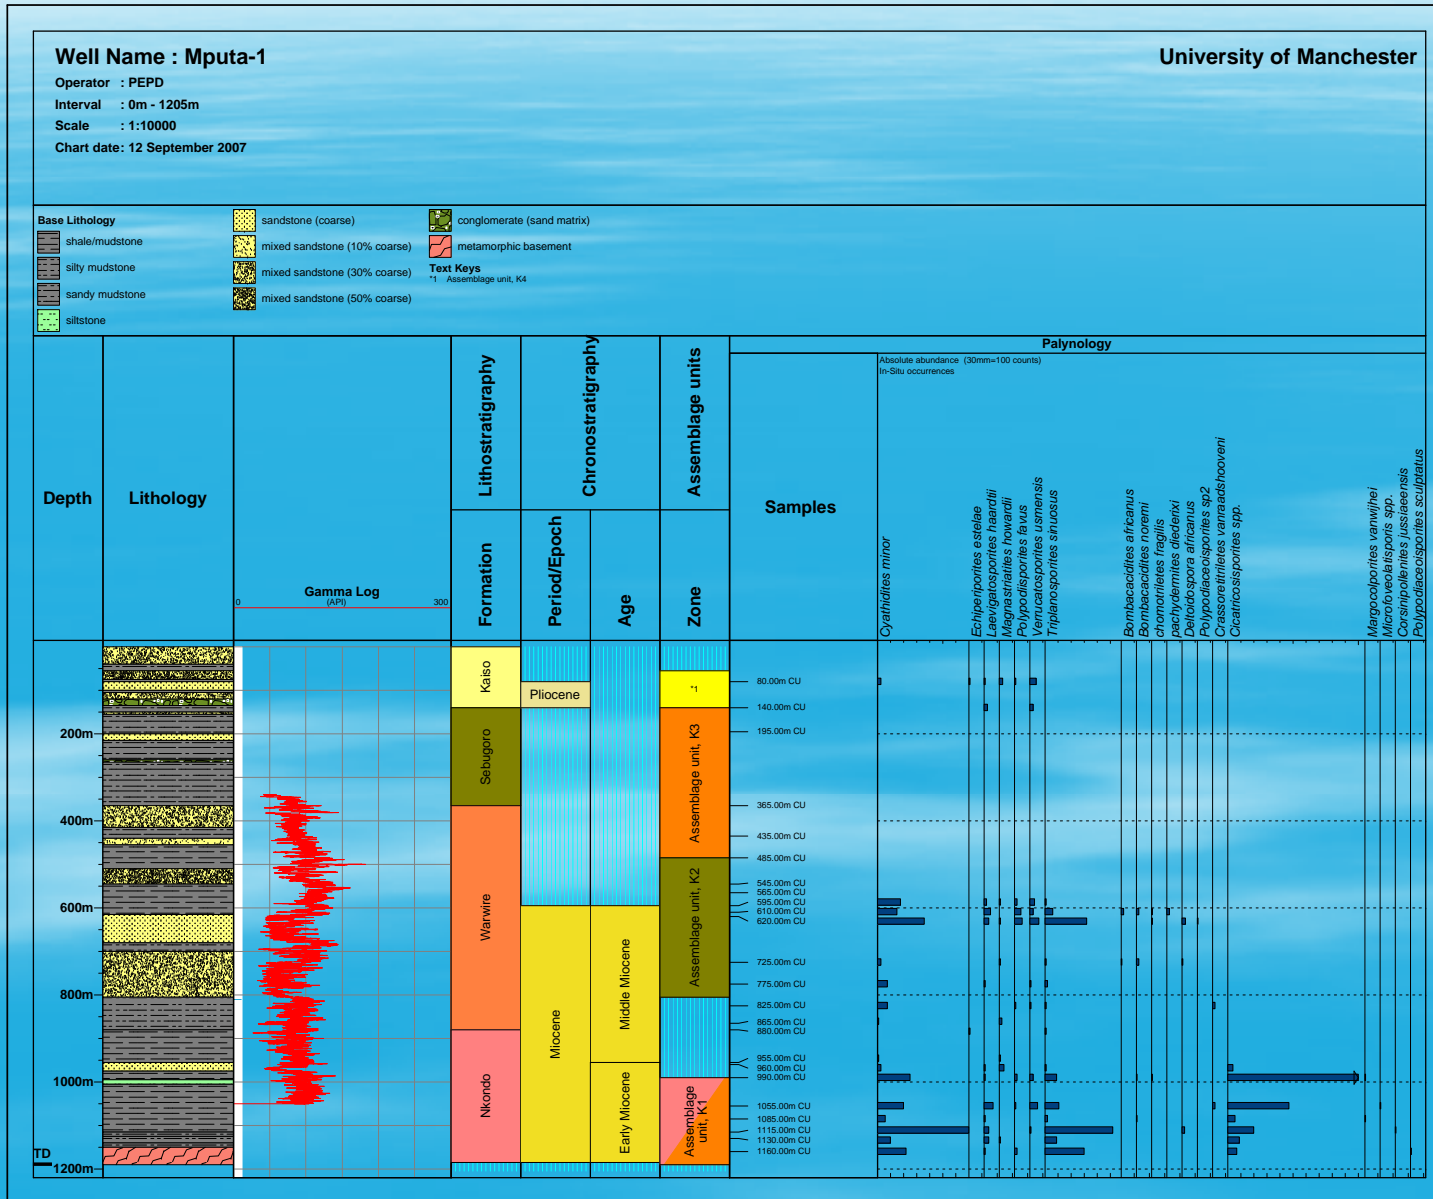

- 580 m - 200 m,
- Absent in other wells

# PRELIMINARY RESULTS Contd.

•Shallow sections of the Mputa-1 wells lean of palynomorphs

•Deeper sections characterised by an influx of spores

# PRELIMINARY RESULTS Contd.

- Shallow sections of the Mputa-2 well lean of palynomorphs
- Deeper sections characterised by an influx of spores

Well Name : WARAGA-1

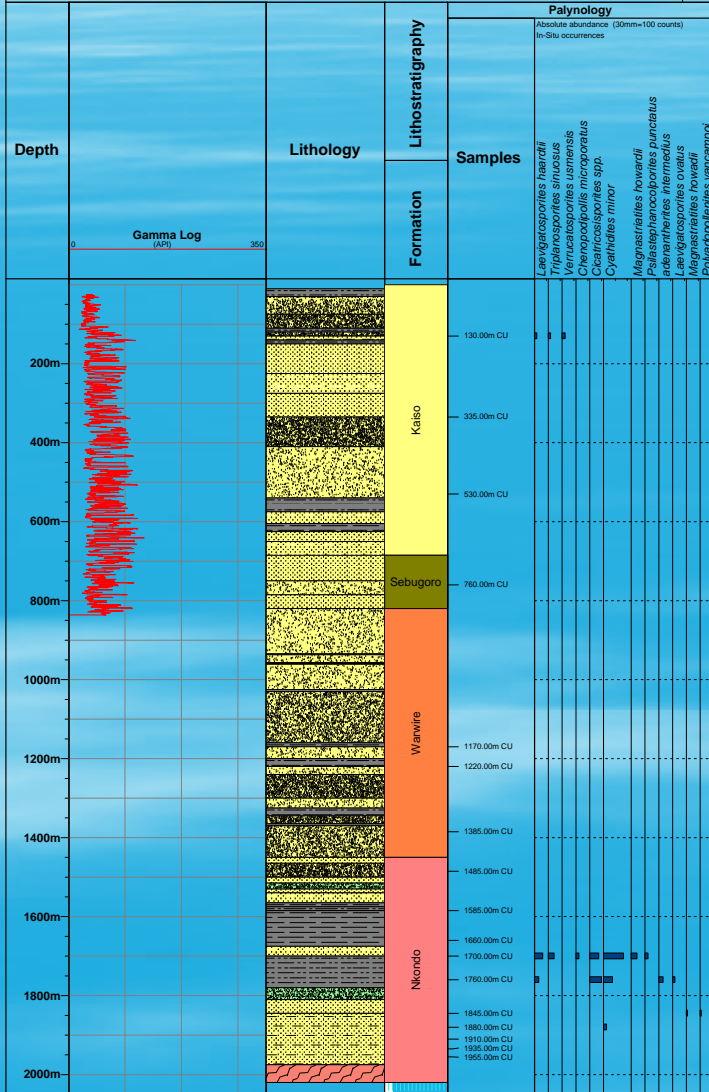

University of Manchester

Interval : 0m - 2040m

Scale : 1:10000

Chart date: 12 September 2007

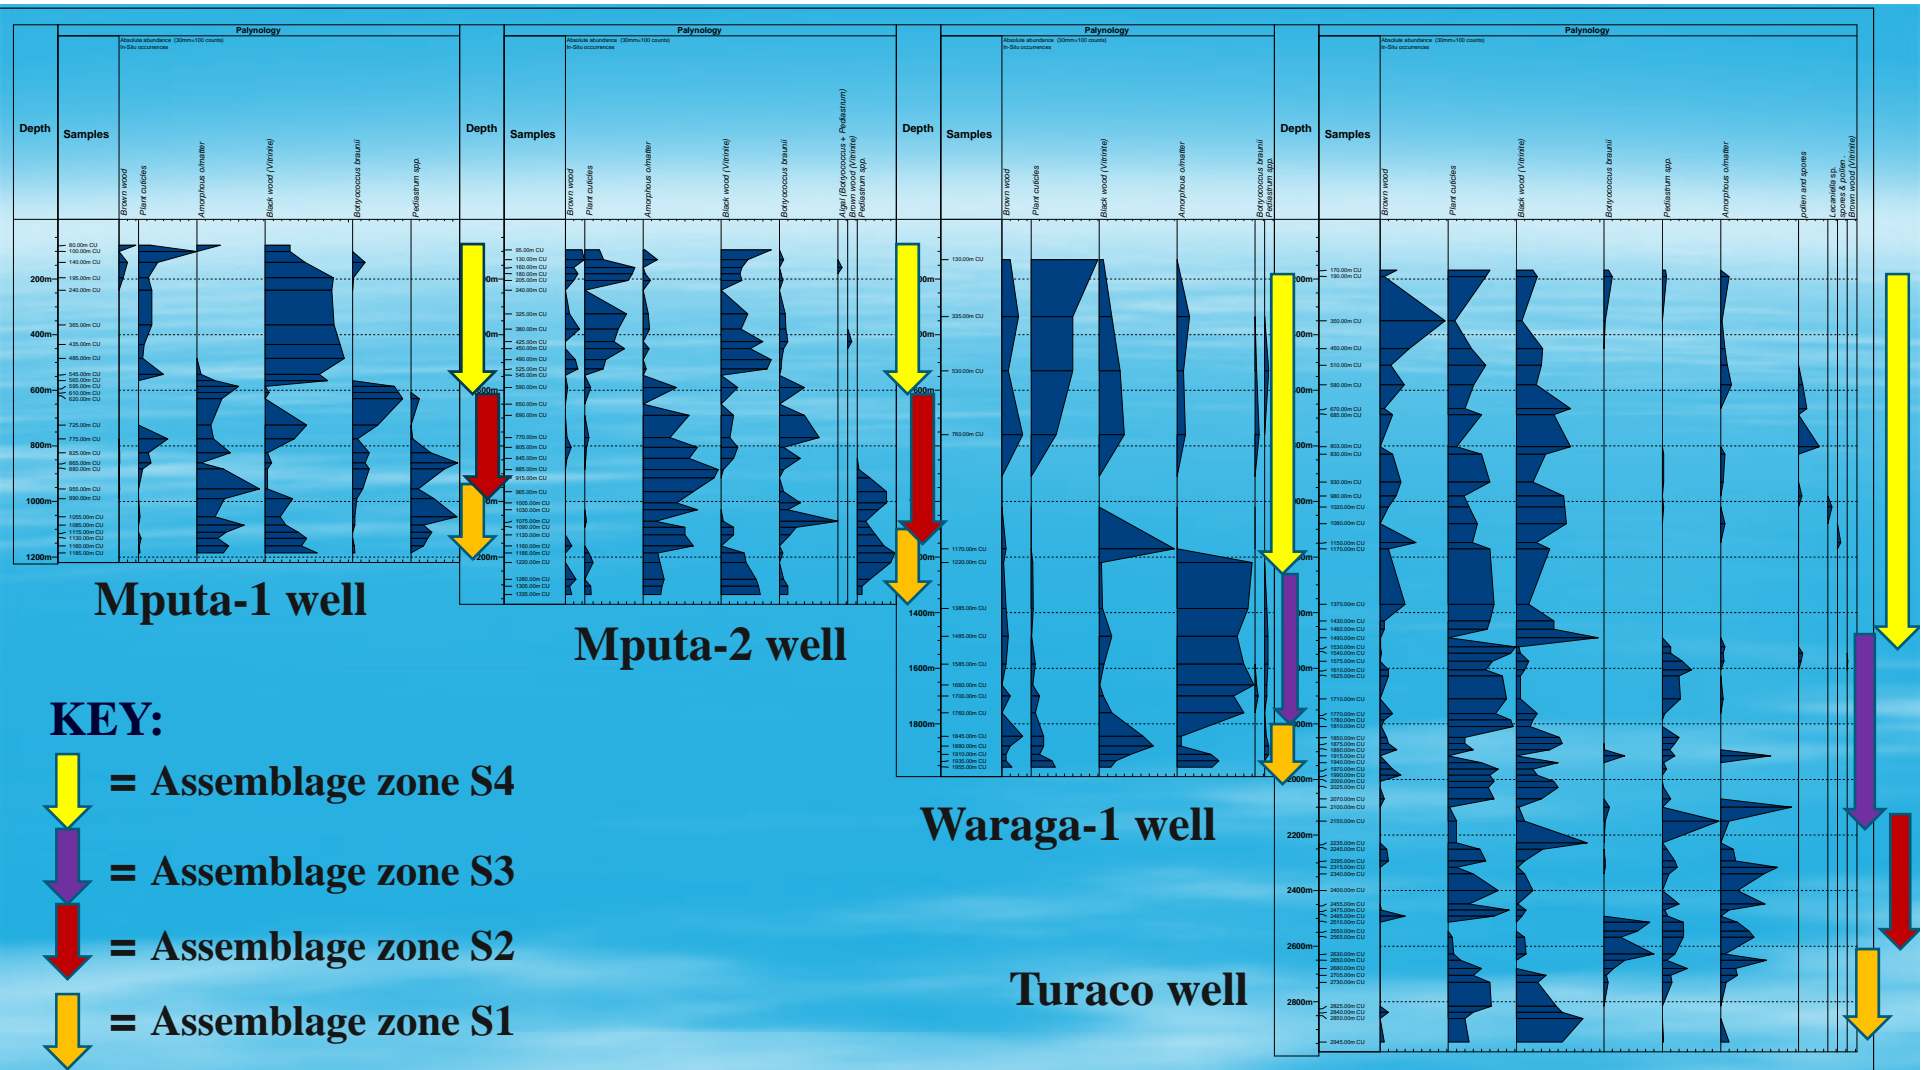

Base Lithology	
	sandy siltstone
	clay
	shale/mudstone
	silty mudstone
	sandy mudstone
	sandstone (fine - medium)
	sandstone (coarse)
	argillaceous sandstone
	mixed sandstone (10% coarse)
	mixed sandstone (30% coarse)
	mixed sandstone (50% coarse)
	coal/lignite

## PRELIMINARY RESULTS Contd.

- The entire Waraga-1 well was almost lean of palynomorphs apart from a few sporadic occurrence towards the base of the well

- Palynofacies and wireline log data for the four wells however show similarities

Comparison of palynofacies data associations within the four wells shows :

**1. *V.usmensis-E.Estalae***

Not clear: Mputa-1  
 Not clear: Mputa-2  
 Not clear: Waraga-1

**2. *G. gracilis-P. vancampoi***

485m (base): Mputa-1  
 525m (base): Mputa-2  
 1600m (base): Waraga-1

***V. usmensis* zone**

800-485m: Mputa-1  
 771-525m: Mputa-2  
 Not clear: Waraga-1

# AGE OF ZONES: Comparisons with the Muglad Basin, S. Sudan.

Age Ma	Period	Age	Litho Strat.	Palynoevents

*Palynozones within the Muglad Basin, S. Sudan*

# AGE OF ZONES: Comparisons with the other areas in Africa

## 1. *V. USEMENSIS-E. ESTALAE* ZONE

- *V. usmensis*: Pliocene-Miocene: Burundi (Sah, 1967)
- FDO *M. howardii*- Pleistocene: intertropical areas of Africa, S. America and Asia (Germeraad *et al.*, 1968)
- FDO of *V. usmensis*, *E. estelae* and *P. Diederixi*: Pliocene in Congo, Gabon, Cameroon, Angola, Nigeria Togo, Niger and Mali (Salard-Cheboldaeff , 1990)
- **Suggested age:** Mid Pliocene-Pleistocene

## 2. *G. GRACILIS - P. VANCAMPOI* ZONE

- Worldwide increase in Miocene-Pliocene (Germeraad *et al.*, 1968)
- FDO *P. vancampoi*: Miocene, Congo, Gabon, Cameroon, Angola, Nigeria, Togo and Niger-Mali. (Salard-Cheboldaeff, 1990)
- FDO *R. irregularis*: Pliocene of above basins (Salard-Cheboldaeff, 1990) and Pliocene of Burundi (Sah, 1967).
- **Suggested age:** Early/mid Pliocene age

# AGE OF ZONES: Comparisons with the other areas in Africa.

## 3. *VERRUCATOSPORITES USMENSIS* ZONE

- High *V. usmensis* & *C. Vanraadshooveni*: Mid-Miocene zone in Niger delta (Oboh et al., 1992, Oboh & Salami, 1989)
- LDO of *P. Diederixi*: Mid-Miocene, Niger delta (Oboh et al., 1992 and Oboh & Salami, 1989)

**Suggested age:** Late Miocene-Early Pliocene

## 4: *C. MINOR-T. SINUOSUS* ZONE

High numbers of *M. howardii*:

- Late and Mid Miocene: Niger delta (Oboh *et al.*, 1992 and Oboh & Salami, 1989)
- Early Miocene: Cameroon (Rull, 2001)
- Early Miocene-Oligocene intertropical areas of Africa, S. America and Asia (Germeraad *et al.* 1968)

### **LDO *C. Vanraadshooveni*:**

- Useful marker of Mid-Upper Miocene in the Niger delta (Oboh & Salami, 1989 and Oboh *et al.*, 1992)
- Lower Miocene–Pliocene the basins of Nigeria, Togo and Niger-Mali. (Salard-Cheboldaeff, 1990).

**Suggested age:** Early-Mid Miocene

# Boundaries of suggested assemblage zones

**Boundaries between the individual zones suggested only tentatively defined because;**

- Precise stratigraphic ranges of many of the species encountered not accurately known in the area studied.
- There are long barren intervals in many of the thick sandy sequences.
- Diagnostic fossils were encountered only occasionally in some intervals.
- Shale bed sequences yielded the largest and most diverse palynofloras, but they represent only a small part of the total section.
- Some of the spore and pollen ranges do not seem to conform to those reported for the taxa elsewhere .

# PALYNOFACIES ANALYSIS

- Analysis of palynodebris, palynomorphs and algal remains.
- Used to:
  - asses major changes in depositional energy levels, hence, the likely depositional settings (from distributional changes).
  - Asses salinity variations basing on variations in abundance of marine, brackish water and terrestrially derived taxa.
  - To suggest the general palaeocology an palaeoclimate of area basing on specific palynomorph abundances.

# PALYNOFACIES ANALYSIS

Four Assemblage units established: S1, S2, S3, & S4

**Unit S1:** high black wood, plant cuticles and low *Pediastrum* & *Botryococcus* sp.

•Suggestive of delta front, prodelta or fluvial-deltaic facies (Nagy *et al.*, 1984; Tyson, 1987, 1995).

**Suggested:** Deltaic inner lacustrine conditions

**Climate within S1:** warm & hot, generally dry climate at the time: due to scarce fern spores

# PALYNOFACIES ANALYSIS

**Unit S2;** abundant *Botryococcus* sp., *Pediastrum* sp., AOM and common-abundant fern spores.

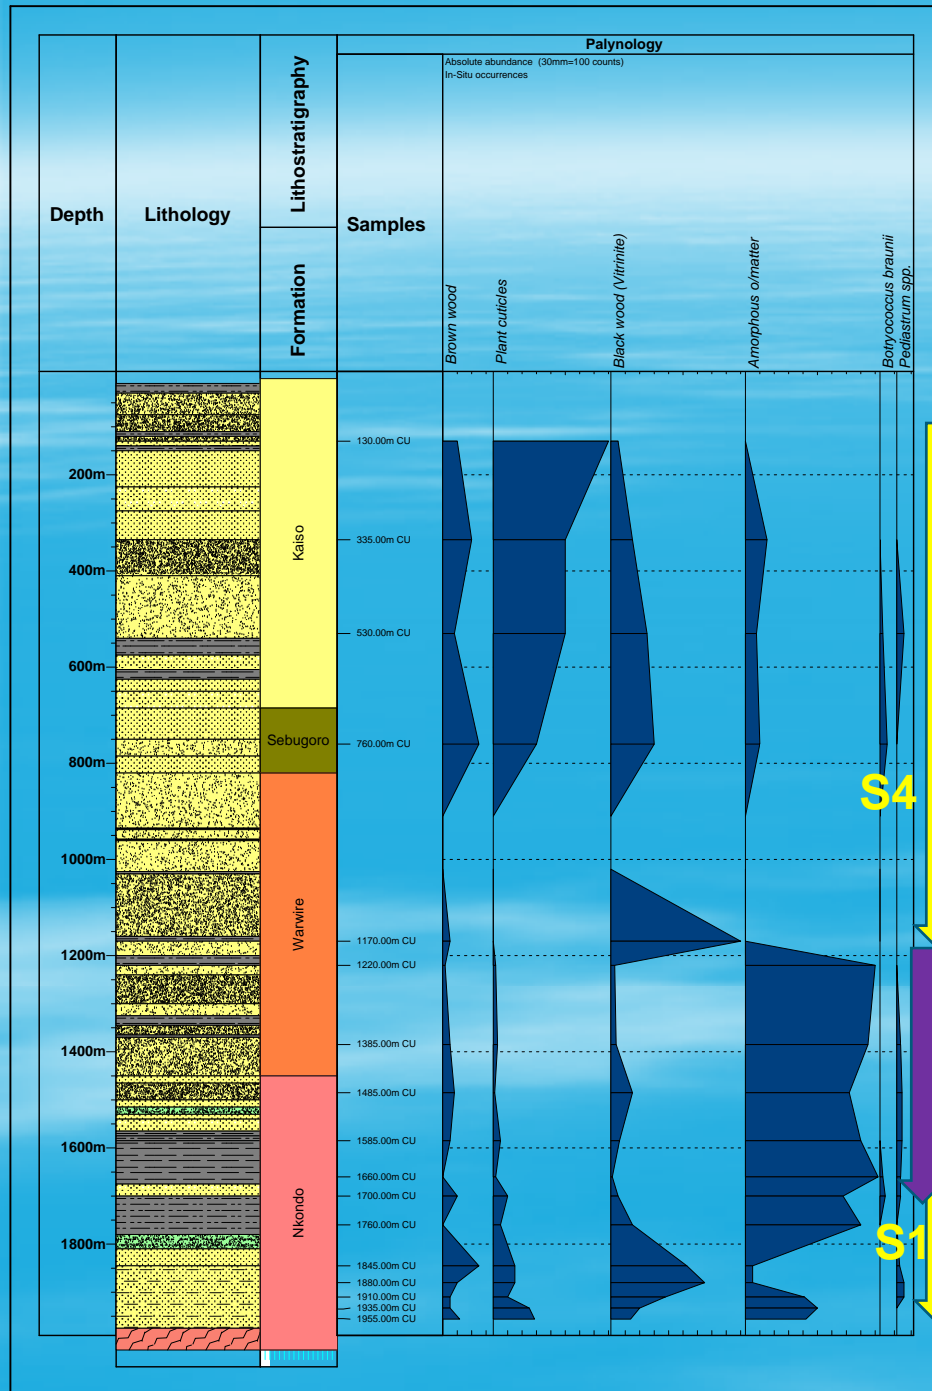

•Suggestive of deposition by low energy currents in reducing, fresh-brackish waters free from sediments and subaerial plants

(i.e. fresh-brackish water open lacustrine conditions)

**S2**•Climate: warm and wet due to abundance of fern spores.

S1

# PALYNOFACIES ANALYSIS

**S3:** High *Pediastrum*, AOM, plant cuticles, and black wood, and fern spores.

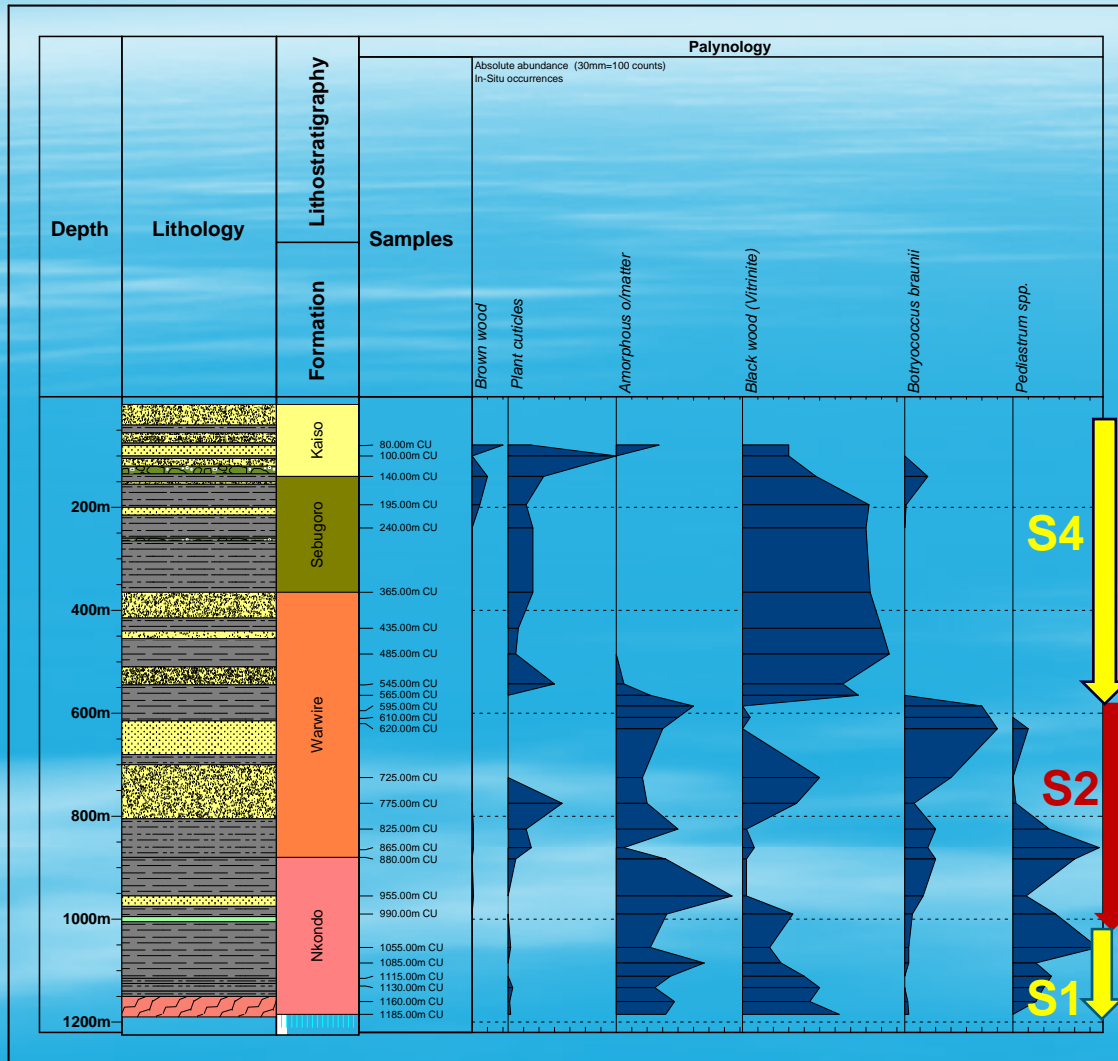

A marginal-lacustrine facies with fresh-brackish water marsh-swamp/lagoonal and/or deltaic depositional setting suggested.

**Climate:** moist, warm and fairly humid. Wetter and more humid than S2.

# PALYNOFACIES ANALYSIS

**Unit S4:** abundant grass pollen, fern spores; plant cuticles, black wood, brown wood in fine-v.coarse lithofacies

•Suggestive of deposition by high-energy tractional currents in a shallow, oxidising, fluvio-deltaic environment probably along active river channels close to sediment source.

•**Climate:** warm and dry as shown by abundant *Graminae* pollen and low fern spores.

# CONCLUSION

- The oldest subsurface sediments suggested to be Early-Mid Miocene.
- Depositional environments varies from fresh-brackish water open lacustrine through marginal lacustrine facies to fluvio-deltaic environments.
- Areas represented by deeper successions were wet and warm while shallower successions were drier.
- The sediments within the two basins are comparable/correlatable
- Future plan: integrate palynological studies with chemostratigraphy, wireline log analysis, among others to fine tune further most of the aspects discussed.
